

The Human Circulatory System

The heart is a muscle in your chest made up of four chambers:

- the right atrium;
- the left atrium;
- the right ventricle;
- the left ventricle.

Your heart is protected by your ribs and pumps blood around your body. This is what happens:

Your blood 'picks up' the oxygen from your lungs and then it travels to your heart. The heart pumps or pushes the blood around your body by using the muscles in its walls. These muscles contract to push the blood around the body. Arteries carry the blood to every part of your body so your muscles and organs can use the food and oxygen to make them work. Veins carry blood back to your heart when all the oxygen has been used so the blood can be pumped back to your lungs again to 'pick up' more oxygen.

Human circulatory system

The circulatory system is one of the most important systems in the body. Made up of the **heart, blood and blood vessels**, the circulatory system is your body's delivery system. Your heart plays an important part in being healthy. It keeps all the blood in your circulatory system flowing. Blood helps oxygen get around your body. When you **exercise** you can feel your pulse, it tells you how fast your heart is pumping.

The body's circulatory system is responsible for transporting materials throughout the entire body. It **delivers nutrients, water, and oxygen** to your billions of body cells and **carries away wastes** such as carbon dioxide that body cells produce. It is an amazing highway that travels through your entire body connecting all your body cells.

At the centre of this system is the heart, an amazing organ. **The heart beats about 3 billion times during an average lifetime.** It is a muscle about the size of the fist. The heart is located in the centre of the chest slightly to the left. **Its job is to pump blood and keep the blood moving throughout the body.** The blood is pumped around a complex network of blood vessels extending to every part of the body.

Blood carries the oxygen and nutrients needed to fuel the activities of the body's tissues and organs, and it plays a vital role in removing the body's waste products. An average-sized adult carries about 5 litres (9 pints) of blood.

Top 10 facts

1. If you were to lay out all of the arteries, capillaries and veins in one adult, end-to-end, they would stretch about **60,000 miles** (100,000 kilometres).
2. It takes **20 seconds for blood to circulate the entire body.** Oxygenated blood leaves the aorta at about 1 mile an hour.
3. The power output of the heart ranges from 1-5 watts per minute, which is the equivalent to the usage of a 60 watt bulb. It has been said that enough energy is produced by the human body in a day to drive a truck 20 miles.
4. **Red blood cells** live for up to 4 months and make approximately 250,000 round trips around the body before returning to the bone marrow, where they were born, to die.
5. Between 2.5 and 3 million red blood cells (called **erythrocytes**) are lost and replaced every second.
6. Across the animal kingdom, **heart rate is related to body size:** in general, the bigger the animal, the slower its resting heart rate. An adult human has an average resting heart rate of about 75 beats per minute, the same rate as an adult sheep. But a blue whale's heart is about the size of a small car, and only beats five times per minute. A shrew, on the other hand, has a heart rate of about 1,000 beats per minute.
7. The **ancient Egyptians** believed the heart, rather than the brain, was the source of emotions, wisdom and memory, among other things.
8. After circulating within the body for about 120 days, a red blood cell will die from aging or damage. **Bone marrow constantly manufactures new red blood cells** to replace those that perish.
9. The oxygen-rich blood that flows through your arteries and capillaries is bright red. After giving up its oxygen to your bodily tissues, your blood becomes dark red as it races back to your heart through your veins.
10. "**Ventricle**" means "little belly".

Did you know?

- We see and hear about hearts everywhere. A long time ago, people even thought that their emotions came from their hearts, maybe because the heart beats faster when a person is scared or excited. Now we know that emotions come from the brain, and in this case, the brain tells the heart to speed up.
- **Your heart is a very strong muscle** that pumps blood around your body. It is made of four chambers, two upper chambers and two lower chambers. Blood enters the upper chambers. These squeeze and push the blood into the lower chambers, which then squeeze and push the blood out of your heart.
- The heart works tirelessly – more than 2.5 billion times over an average lifetime – to pump blood around the body. The heart's **contractions** or 'squeezes' are triggered by electrical impulses that come from a specialised area of heart tissue.
- Your **pulse** is a measure of how fast your heart is beating. It is the number of beats your heart makes in one minute. Your heart beats faster or slower depending on what you are doing. You can feel your pulse at certain points on your body. The easiest place to feel it is in your wrist, using the first two fingers of your other hand. When you sit, the average heart beats about 80 times per minute. However, everybody is different, so your pulse could be higher or lower than this.
- When you **exercise**, your heart beats more quickly. This is because your muscles are working harder and need more oxygen to keep going. Your **lungs** also work harder, making you breathe more quickly to get more oxygen. When you sleep, your muscles need less oxygen, so your heart slows down.

Blood transports materials around the body and protects against disease. It contains:

- **Red blood cells** which transport oxygen.
- **White blood cells** which protect against disease.
- **Blood platelets** which help the blood to clot and repair a cut.
- **Plasma** which is a liquid that carries these cells. It also transports important nutrients.

What are arteries?

Arteries are the large vessels that carry blood through the heart, around to every part of your body. The blood that arteries carry from the lungs is full of oxygen.

As they get closer to the surface or into smaller spaces, blood is transferred into microscopic vessels called **capillaries**.

When the blood has released its oxygen, it returns back to the lungs and heart through veins.

What are veins?

If you could see the blood in your veins, it would look a lot darker than it was in your arteries.

The movement of the blood through the heart and around the body is called circulation – and your heart is really good at this.

FACT Did you know?

It takes **less than 60 seconds** to pump blood to every cell in your body!

A cool thing is, it doesn't matter if you're standing on your head or jumping on a trampoline, blood keeps pumping – all the way around the body.

Clever doors called **valves** make sure that the blood can't go the wrong way. Blood has to travel in **one direction** only.
